

Supply Chain Logistics Manager - User Workflow & Journey Map

Confidential - Internal Use Only

Version 1.0

1. Shipment Creation & Carrier Selection

Workflow WF-LOG-001: Create and Book Shipment

Step 1: Dispatcher clicks 'Create Shipment' on dashboard. Wizard opens. Enters origin address (autocomplete via Google Places API) and destination address.

Step 2: Package details: number of pieces, weight (kg/lb toggle), dimensions (L x W x H per piece), declared value, package type (envelope, box, pallet, custom).

Step 3: Service requirements: desired delivery date, service level (Express, Ground, Economy), special handling (Fragile, Hazmat, Temperature-controlled), insurance required.

Step 4: System queries all integrated carrier APIs in parallel. Rate quotes returned within 3 seconds. Comparison table displayed with carrier, service, transit days, total cost.

Step 5: Dispatcher selects carrier. System validates address format for selected carrier. Generates shipping label (PDF or ZPL for thermal printers).

Step 6: Pickup scheduled with carrier (same-day if before carrier cutoff, next business day otherwise). Confirmation email with tracking number sent to shipper and consignee.

Step 7: Shipment enters 'Created' status. Label and commercial invoice (if international) available for download and print.

Alternate Path AP-1: If saved shipment template used, Steps 1-3 pre-populated. Dispatcher reviews and modifies as needed.

Alternate Path AP-2: If no carrier provides acceptable rate/transit, dispatcher receives 'No suitable carriers' with recommendation to adjust service level.

2. Warehouse Pick-Pack-SHIP Flow

Workflow WF-LOG-002: Order Fulfillment in Warehouse

Step 1: Order received from ERP/OMS system via API. Order details: customer, items (SKU, quantity), priority, ship-by date.

Step 2: Wave planning algorithm groups orders by warehouse zone and priority. Generates optimized pick lists for warehouse workers.

Step 3: Worker receives pick list on handheld scanner (Zebra MC9300). List shows bin location, SKU, quantity. Walk path optimized to minimize travel distance.

Step 4: Worker scans each item at bin location. System validates SKU match. Quantity confirmation. If item not at expected bin, system suggests alternate locations.

Step 5: All items collected and brought to packing station. Packer scans items, system recommends box size based on item dimensions. Packer confirms packaging.

Step 6: Packing slip auto-printed. Weight verified on integrated scale. If weight differs from expected by > 10%, alert raised for verification.

Step 7: Shipping label printed (carrier selected based on predefined rules or dispatcher override). Package placed in staging area sorted by carrier.

Step 8: Carrier pickup scan completes handoff. Shipment status updated to 'Picked Up'. Customer notification sent.

Error Path EP-1: If item is out of stock during picking, partial fulfillment option.

Backordered items queued for restock notification.

3. International Shipment with Customs Clearance

Workflow WF-LOG-003: International Customs Processing

Step 1: Shipment created with international destination. System detects country and flags

customs requirements.

Step 2: Product data reviewed: HS codes assigned (AI-suggested with 90% accuracy, user confirms). Declared values entered per item.

Step 3: Denied party screening auto-runs against BIS Entity List, OFAC SDN list, and EU Consolidated List. Results within 5 seconds.

Step 4: If screening passes, customs documents generated: Commercial Invoice (3 copies), Packing List, Certificate of Origin (if applicable), AES/EEI filing (if value > \$2,500).

Step 5: Duty and tax estimation calculated based on HS codes, declared values, and destination country tariff schedule. Landed cost shown to shipper.

Step 6: Documents attached to shipment electronically. Paper copies printed for carrier packaging if required by destination country.

Step 7: Carrier submits pre-clearance data to destination customs authority. Clearance status tracked: Submitted, Under Review, Cleared, Held.

Step 8: If shipment held at customs, exception alert sent to compliance team with hold reason and required actions.

Error Path EP-2: If denied party match found, shipment creation blocked. Compliance officer alerted with match details for review.

4. Delivery Exception Handling

Workflow WF-LOG-004: Exception Management & Resolution

Step 1: Carrier reports delivery exception via webhook or status update. Exception types: Weather Delay, Address Issue, Customs Hold, Damaged, Refused.

Step 2: Exception appears on dashboard with red badge. Push notification sent to assigned dispatcher.

Step 3: Dispatcher reviews exception details: carrier notes, last known location, photos (if available). 'Resolve' button opens action panel.

Step 4: Resolution options depend on type: Re-route (new address), Reschedule (new delivery date), Return to Sender, File Claim (damage), Contact Customer.

Step 5: Resolution action communicated to carrier via API. Updated ETA or return instructions sent to customer.

Step 6: Exception closed when resolved. Root cause categorized for carrier scorecard reporting.
